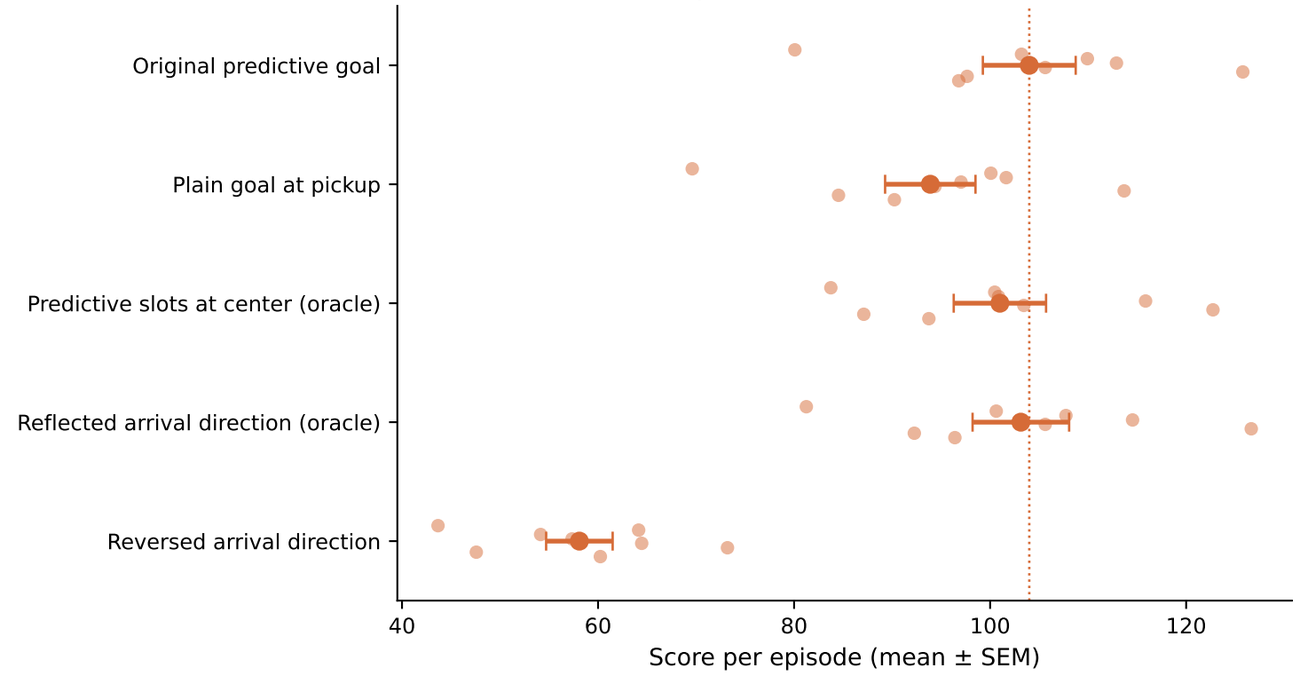
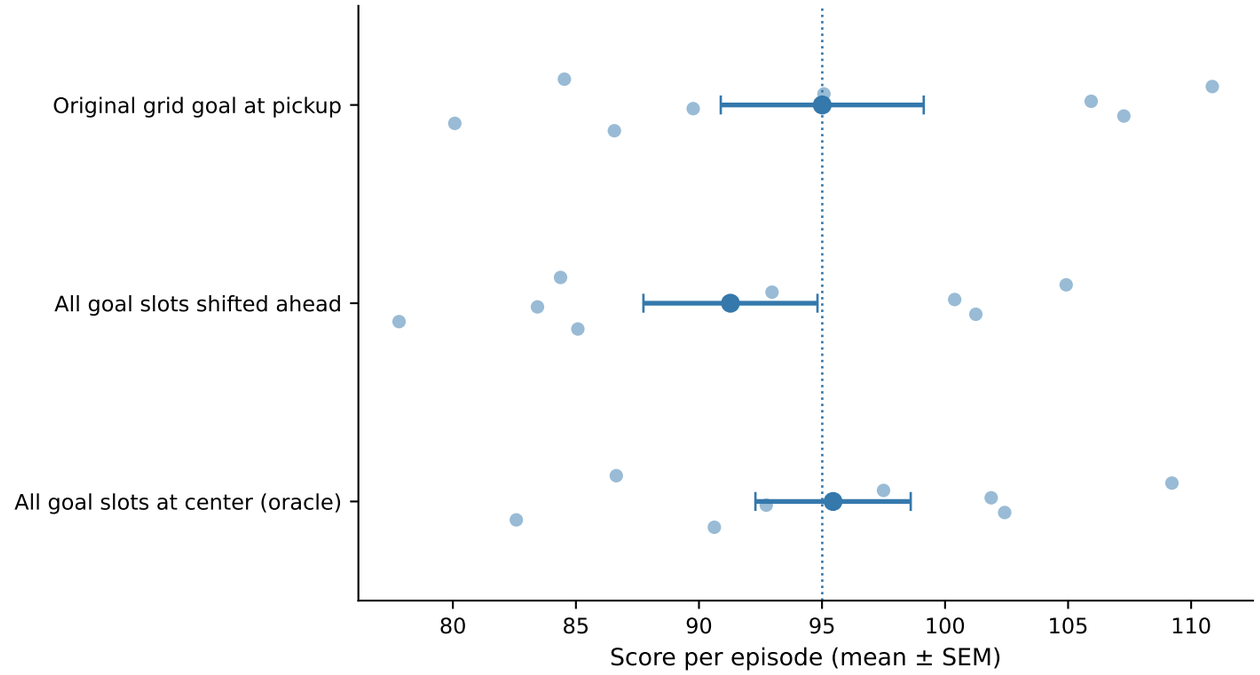
Does the predictive goal snapshot provide a better place to aim for?

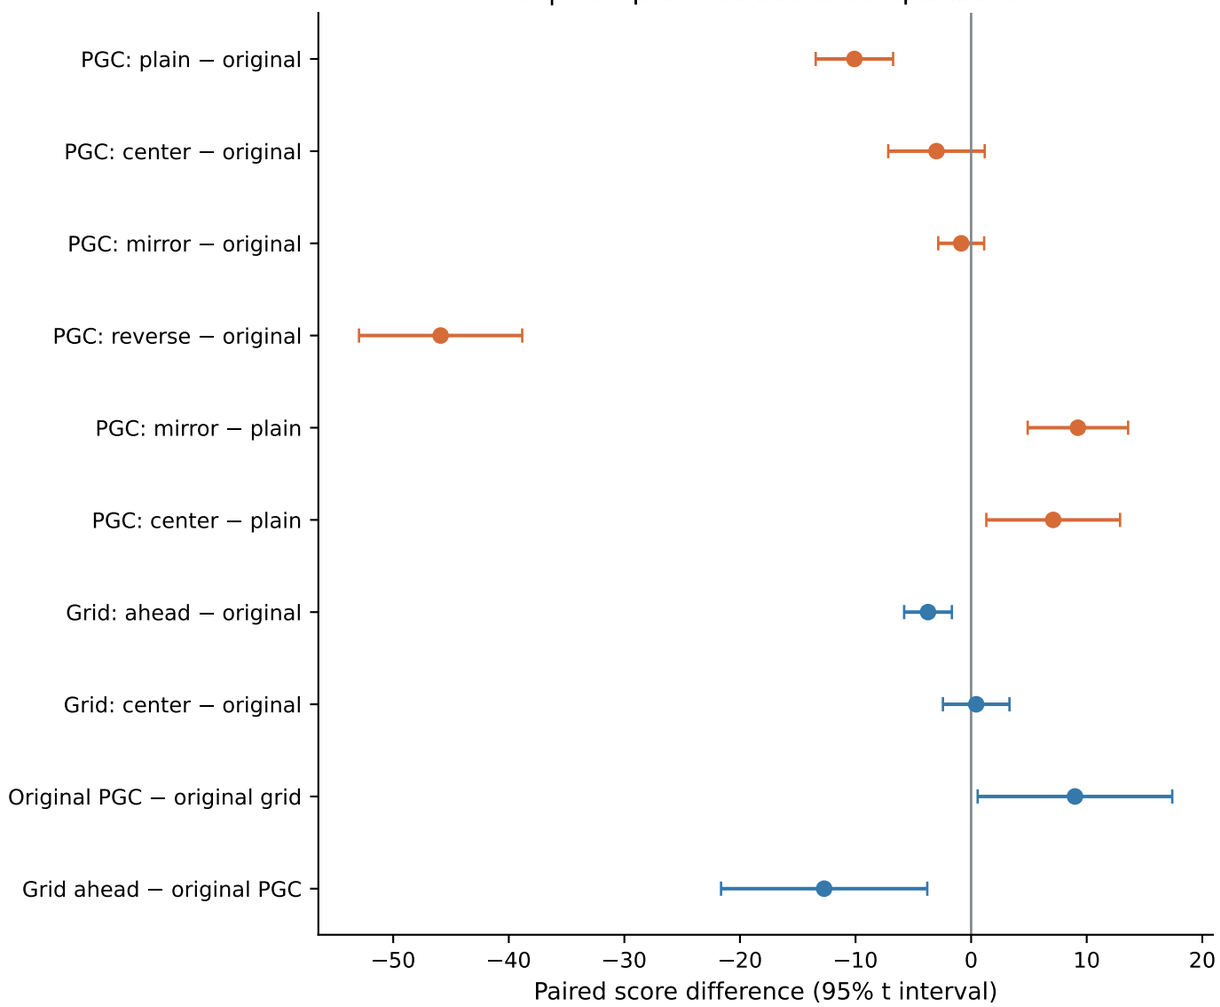
A | PGC-trained networks



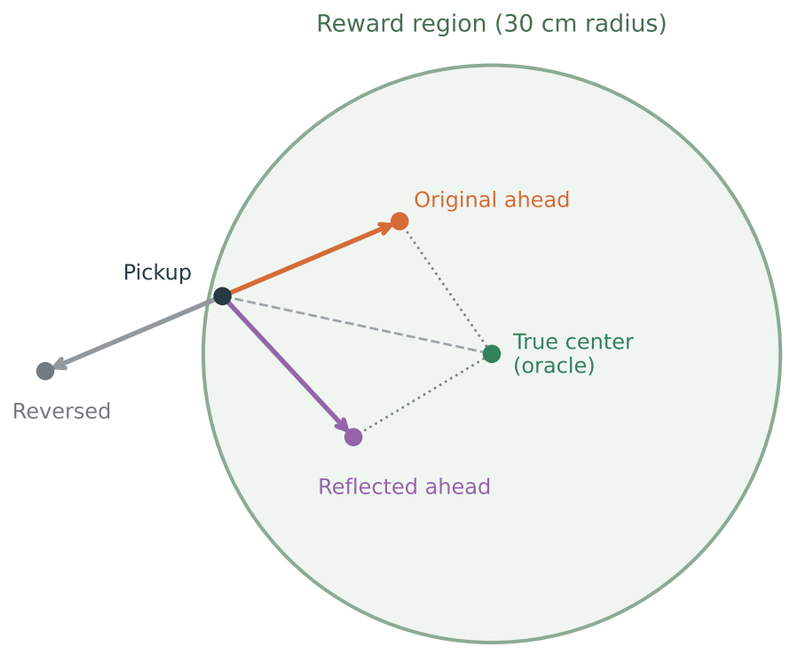
B | Grid-trained networks



C | Ten planned score comparisons



D | What the reflection controls



Original and reflected points:
same 20 cm shift; same distance to center.
Only the sideways arrival component flips.

Frozen 1B models; 8 paired training seeds × 128 episodes per variant. Dots in A/B: seed means.
Only goal snapshots change; current code stays intact. Center and reflection controls use privileged goal coordinates. Diagram is illustrative.
